

PCB Design 5: Design PCB boards by creating and importing components.

DC to DC conversion

Design the following circuit (DC to DC conversion) by creating or import all devices.

The device's footprint and symbol must be present in the schematic and PCB board.

Components need to be creating:

- Input, output connector and the capacitor. Where the interface connectors DC-JACK are used for the input 24V, while the connector is used for the output connection of 12 V.

Components need to be import:

- Diode, voltage regulator and the resistor
