

Problem

A network has its transfer function as

$$H(s) = \frac{s + 1}{(s - 2)(s + 3)}$$

The network is stable.

- (a) True
(b) False

Step-by-step solution

Step 1 of 2

Draw the complex s-plane for the transfer function:

Figure 1

Step 2 of 2

From Figure 1, it is clear that one pole is existed in right half of the complex plane. So, the network is unstable.

Therefore, the statement that the network is stable is **False**.
